

flightlogics

Our vision is safe aviation outcomes

Flight Logics gives you
full SMS functionality
without carrying the overhead.

Flight Logics provides
low cost safety
department solutions.

Flight Logics provides aviation specific safety management support services to small & medium sized aircraft operators and engineering maintenance providers.

Our services enable small to medium sized aviation businesses to have a safety department with the same functionality as a large operator at a fraction of the cost.

Scale your safety department & retain the necessary functionality.

Major airlines are able to support a full-time team of safety professionals that deliver the key functionality required to make a safety management system work.

These key functions include:

- Safety investigation
- Safety auditing
- Documentation development
- Emergency response planning
- Risk management
- Safety communication
- Safety administration
- Human factors analysis
- Flight data analysis
- Safety management training
- Work health and safety
- Change management
- Security

No matter how small a company may be it is impossible for just one person (eg, the Safety Manager) to provide all of this functionality effectively.

Improve your safety culture

Small to medium sized companies have unique challenges due to the close and tightly knit relationships that exist between all members of the company at all levels.

This may make it difficult when performing safety investigations and safety audits. Take advantage of our independent safety investigation and audit services. It will help take the emotion and anxiety out of a tricky situation.

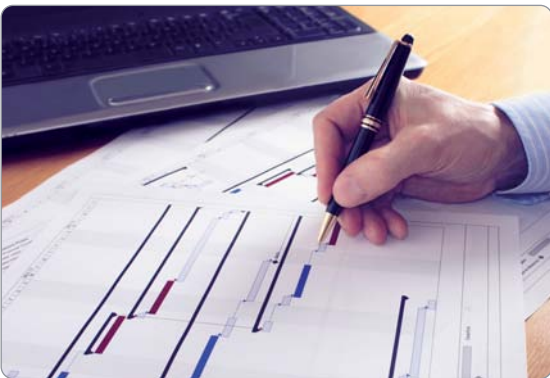

SMS for Part 135 and 121 operators

Some Part 135 and 121 operators have already embraced SMS but many are now confronted with the need to introduce a full safety management system from "scratch". Flight Logics can provide you with the one to one support and guidance to help your company develop and implement your new safety management system.

We will provide a fixed price quotation for this service

It includes:

- The gap analysis
- SMS project plan and implementation management support
- Software solutions
- Company specific SMS training
- Ongoing safety office support

**Aviation
Safety
Community**

Flight Logics with the support of CASA launched the Aviation Safety Community (ASC) in July 2018. The ASC's core purpose is to provide safety leadership to aviation organisations through open forums, safety training and safety research. To date we have run seven safety forums which we now stream on webinars.

Visit the ASC website for more information www.aviationsafetycommunity.com.au
